Brushless Motor Technology

November 2007

THE NEW BRUSHLESS MOTOR “METAL MICKEY” IS FORWARD VISION’S QUIETEST AND SMOOTHEST-EVER PTZ CAMERA

Forward Vision’s leading ‘Metal Mickey’ MIC1 series of Pan, Tilt & Zoom (PTZ) CCTV cameras have been enhanced to include brushless motors as standard* - delivering superior control, virtually silent operation and unmatched reliability. The company believes this makes the brushless MIC1 the smoothest, most versatile PTZ camera currently available on the market. The virtually silent operation ensures that sound does not resonate through buildings and poles where the cameras are installed, a common problem with many other PTZ cameras.

Richard Markham, one of the founding design engineers at Forward Vision said, “The introduction of brushless motors comes after a full year of research and development and ensures that we remain at the forefront of PTZ camera technology. Having successfully completed a full programme of field testing, we are now including brushless motors in all new-build cameras”.

All MIC1 series cameras are proven to deliver reliable performance in the most demanding conditions, but the use of brushless motors will deliver much longer life span and reliability. The MIC1 series is backed by a full three-year warranty for added certainty.

All the attributes that have made the MIC1 series the top PTZ camera in the UK over the last 5 years, such as an IP68 rating for optimum protection against the elements, optically perfect flat viewing window and vandal resistant design, are retained. The MIC1 series consists of aluminium, stainless steel, infrared, underwater, thermal, ATEX certified, static and public address system ranges, and each with a host of camera, mounting and accessory options, to ensure a best-fit solution can be achieved for virtually any application - regardless of the installed environment.

*Excludes ATEX certified and Static ranges
