Forward Vision enhances infrared units

May 2008

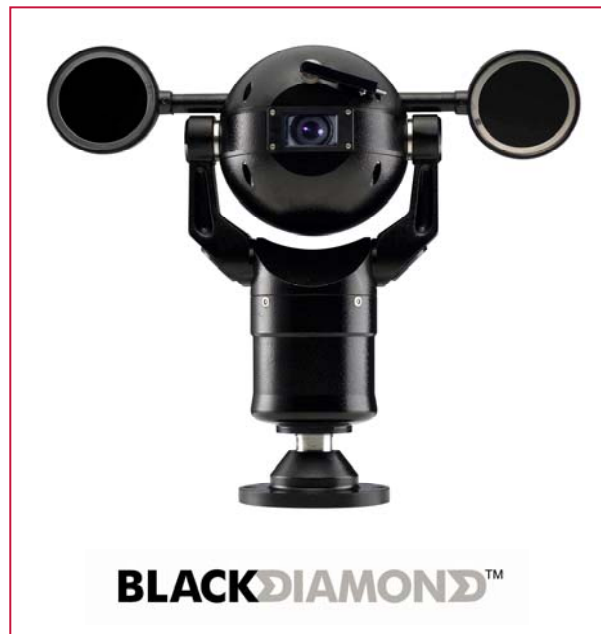

FORWRD VISION'S MIC1 SERIES NOW SHIPPING WITH BLACKDIAMOND™ ILLUMINATORS

Forward Vision, a member of the Bosch Group, announces that all infrared models in the MIC1 series of fully functional Pan/Tilt/Zoom (PTZ) cameras are now shipping with enhanced built-in illuminators from leading infrared specialists Derwent Systems.

Featuring BlackDiamond™ technology to totally negate image “hot-spots”, a common problem with other infrared illumination, the light provided by the twin 850nm illuminators gives outstanding night-time picture quality to a distance of 55 metres.

James Smith, general manager of Forward Vision, states “As well as benefitting from enhanced night time surveillance, the new illuminators are rated to IP68 to match the specification of the MIC1 cameras themselves. This ensures reliability in even the toughest conditions – something that our cameras are well renowned for. What's more, we have been able to introduce these class-leading benefits at no extra cost to the client”.

Suitable for a range of applications from town centres to rapid deployment, all MIC1 series cameras benefit from an optically perfect flat viewing window, a choice of 18x or 36x true day/night cameras and brushless motor technology for whisper quiet and accurate control.
